PROJECT REPORT

TITLE: Mess Feedback System

---

1. Introduction

In many colleges, students often face issues related to mess food quality, hygiene, and menu variety. However, there is usually no proper platform where students can share their feedback in a structured manner. This leads to dissatisfaction and lack of improvement in mess services.

This project aims to solve this problem by providing a simple and effective feedback system.

---

2. Problem Statement

Students do not have an organized and efficient system to provide feedback or complaints regarding mess food. Traditional methods like verbal complaints are often ignored or not recorded properly.

---

3. Objectives

- To create a platform for students to submit feedback easily
- To allow rating of meals (Breakfast, Lunch, Dinner)
- To display all feedback in an organized manner
- To calculate and show average ratings
- To improve transparency in mess services

---

4. Proposed Solution

The proposed solution is a web-based application called **Mess Feedback System**.
It allows users to:

- Submit feedback through a form
- Rate meals on a scale of 1 to 5
- View previously submitted feedback
- See average ratings
- Delete feedback entries if required

The system uses local storage to store data, eliminating the need for a backend.

---

5. Methodology

The project follows a simple step-by-step approach:

1. Designing the user interface using HTML and CSS
2. Implementing logic using JavaScript
3. Capturing user input through forms
4. Storing data in browser local storage
5. Displaying feedback dynamically on the webpage
6. Calculating average ratings

---

6. Tools and Technologies Used

- HTML – for structure
- CSS – for styling
- JavaScript – for functionality
- Browser Local Storage – for data storage

---

7. System Features

- User-friendly feedback form
- Meal selection (Breakfast, Lunch, Dinner)
- Rating system (1–5)
- Feedback display section
- Average rating calculation
- Delete feedback option
- Persistent data using local storage

---

8. Implementation Details

The application is built using front-end technologies.
JavaScript is used to:

- Handle form submission
- Store and retrieve data from local storage
- Dynamically update the UI
- Calculate average ratings

Each feedback entry is stored as an object in an array and then saved in local storage.

---

9. Challenges Faced

- Managing data without a backend
- Handling dynamic updates in the UI
- Calculating average ratings correctly
- Ensuring data persistence after page refresh

---

10. Results and Output

The project successfully allows users to:

- Submit feedback
- View all feedback entries
- Check average ratings
- Delete unwanted feedback

The system works smoothly and provides a clean and interactive user experience.

---

11. Conclusion

The Mess Feedback System effectively addresses the problem of unstructured feedback in college mess facilities. It demonstrates how simple web technologies can be used to build useful real-world applications.

---

12. Learning Outcomes

Through this project, I learned:

- DOM manipulation in JavaScript
- Working with local storage
- Event handling
- Building user-friendly interfaces
- Structuring a complete web project

---

13. Future Enhancements

- Add backend (database integration)
- User authentication system

- Admin dashboard
- Graphical data representation
- Mobile responsiveness
